The novel portable energy storage technology, which carries energy using hydrogen, is an innovative energy storage strategy because it can store twice as much energy at the same 2.9 L level as conventional energy storage systems. This system is quite effective and can produce electricity continuously for 38 h without requiring any start-up time.

The compact energy storage can be achieved when the layer spacing is optimized to a high-level stage. Lastly, the size and thickness of 3D-printed energy storage architectures is also an influencing factor with regard to their charge and discharge capacity and rate capability performance (Yang et al. 2013).
