Thermochemical energy storage is divided between chemical reactions and sorption systems. In chemical reactions, high-energy storage density and reversibility is required on the materials (Kato, 2007). Usually chemical energy conversion has better energy storage performance efficiency than physical methods (sensible and latent heat storage).

Despite all the advantages offered by thermochemical storage concepts, the technology is still at an earlier stage of maturity compared to sensible or latent heat storage, although the development of thermochemical storage concepts also began in the 1970s [Wentworth1975]. Thermochemical storage is more complex, and there are challenges for ...
