Compressed air energy storage (CAES) is an energy storage technology whereby air is compressed to high pressures using off-peak energy and stored until such time as energy is needed from the store, at which point the air is allowed to flow out of the store and into a turbine (or any other expanding device), which drives an electric generator ...

A compressed air energy storage (CAES) system uses surplus electricity in off-peak periods to compress air and store it in a storage device. Later, compressed air is used to generate power in peak demand periods, providing a buffer between electricity supply and demand to help sustain grid stability and reliability [4]. Among all existing energy storage ...

In the designed system, the energy storage capacity of the designed CAES system is defined about 2 kW. Liquid piston diameter (D), length and dead length (L, L<sub>dead</sub>) is determined, respectively, 0.2, 1.1 and 0.05 m. The air tank capacity (V<sub>tank</sub>) is 0.5 m<sup>3</sup>. The equations used in system design and modeling are given below.
