"A gas-fired boiler cannot go from zero to 100% capacity in less than two minutes - but an electrode boiler can," says Acme Engineering's Presser. He points out that modern electrode boilers are designed so temperature, pressure, and output can quickly rise or fall as needed with no "flywheel effect."

One of the first considerations when deciding on the size of your boiler is how much hot water you will use or are likely to use in the future. If you have a young family, your needs will likely increase as the children get older. For households with a single bath and shower, a smaller boiler is generally recommended.
