In an ammonia TCES process (), ammonia is dissociated endothermically ($\text{NH}_3 + 66.8 \text{ kJ/mol} \rightleftharpoons \frac{1}{2} \text{N}_2 + \frac{3}{2} \text{H}_2$) as it absorbs solar energy during the daytime. When energy is required, the reverse reaction releases energy to heat a working fluid, such as steam, to produce electricity.
