In the integrated flexible electronic system, energy storage devices 14, 16 - 20 play important roles in connecting the preceding energy harvesting devices and the following energy utilization devices (Figure 1).

In this article, we explore the use of the secondary loop liquid cooling scheme and the heat sink liquid cooling scheme to cool the energy storage cabinet. Mathematically model the evaporator, condenser, compressor in the secondary loop cooling system, as well as the fan in the liquid cooling system, and perform simulation in MATLAB software.

Indirect liquid cooling is currently the main cooling method for the cabinet power density of 20 to 50 kW per cabinet. An integrated energy storage batteries (ESB) and waste heat-driven cooling/power generation system was proposed in this study for energy saving and operating cost reduction.
