The storage efficiency of a cold storage system is equivalent to the amount of energy injected into an aquifer (e.g., energy injected to the aquifer while cooling a building) divided by the amount of energy taken from an aquifer (e.g., energy rejected from the aquifer using a fluid cooler to passively refrigerate the aquifer during cold spells).

It is proven that district heating and cooling (DHC) systems provide efficient energy solutions at a large scale. For instance, the Tokyo DHC system in Japan has successfully cut CO₂ emissions by 50 % and has achieved 44 % less consumption of primary energies [8]. The DHC systems evolved through 5 generations as illustrated in Fig. 1. The first generation ...

Aquifer thermal energy storage (ATES) is a source of renewable energy that is extracted from the subsurface using the heat naturally present in the soil and groundwater. Storing heat and cold in the subsurface is a way of heating and cooling homes and buildings, a need that accounts for 40 percent of global energy demand.

With the world's energy problems still far from being solved, it is commonly agreed upon, that storing energy is a vital part of any possible solution. When discussing the storage, the type of energies must be distinguished. The storage of thermal energy can be accomplished by several means. One of these means is the storing of the thermal energy in naturally occurring water ...
