A magnet is placed on a door frame while the sensor unit is placed on the door. When shut, the door sensor aligns with the magnet and triggers the Hall effect sensor. The Hall effect sensor then turns off when the door is ajar. This theme has many variations that can be integrated into an alarm system or other smart space accommodations. 2.

This low-side sensor placement can only sense current when the low-side switch is on. In-phase isolated amplifiers or Hall-based solutions eliminate the ground difference, enable short detection, and can sense current regardless of switching state. This same concept can be applied to current sensor placement in motor control.

The inverters in solar PV plants convert direct current from the solar panels to alternating current. Increasing application scope of central and string inverters in large scale renewable power plants is bound to jump the solar-inverter market. The Energy Storage Battery Inverter market is expected to grow at a CAGR of 15.7% to reach 33.8 in 2027.
