Electrostatic capacitors can enable ultrafast energy storage and release, but advances in energy density and efficiency need to be made. Here, by doping equimolar Zr, Hf and Sn into Bi₄Ti₃O₁₂ thin films, a high-entropy stabilized Bi₂Ti₂O₇ pyrochlore phase forms with an energy density of 182 J cm⁻³ and 78% efficiency.

Dielectric electrostatic capacitors have emerged as ultrafast charge-discharge sources that have ultrahigh power densities relative to their electrochemical counterparts ¹. However, electrostatic capacitors lag behind in energy storage density (ESD) compared with electrochemical models ^{1, 20}.

However, electrostatic capacitors lag behind in energy storage density (ESD) compared with electrochemical models ^{1, 20}. To close this gap, dielectrics could amplify their energy storage per unit planar area if packed into scaled three-dimensional (3D) structures ^{2, 5}.

In comparison to batteries, supercapacitors exhibit a superior power density and the ability to rapidly store or discharge energy. Nevertheless, their energy density is lower due to the constraints associated with electrode surface charge storage.

Capacitor specifications of capacitance, DC leakage current (DCL), equivalent series resistance (ESR), size, etc. are typically room temperature measurements under a very specific test condition. Furthermore, energy storage capacitors will often be set up in some parallel/series combination that can pose unique challenges or unexpected behaviour.

Capacitors exhibit exceptional power density, a vast operational temperature range, remarkable reliability, lightweight construction, and high efficiency, making them extensively utilized in the realm of energy storage. There exist two primary categories of energy storage capacitors: dielectric capacitors and supercapacitors.
