A capacitor is a device that stores electrical charge. The simplest capacitor is the parallel plates capacitor, which holds two opposite charges that create a uniform electric field between the plates.. Therefore, the energy in a capacitor comes from the potential difference between the charges on its plates.

Energy Storage Equation. The energy (E) stored in a capacitor is given by the following formula: $E = \frac{1}{2} CV^2$. Where: E represents the energy stored in the capacitor, measured in joules (J). C is the capacitance of the capacitor, measured in farads (F). V denotes the voltage applied across the capacitor, measured in volts (V). Derivation of the ...

The energy stored on a capacitor can be expressed in terms of the work done by the battery. Voltage represents energy per unit charge, so the work to move a charge element dq from the negative plate to the positive plate is equal to V dq, where V is the voltage on the capacitor.The voltage V is proportional to the amount of charge which is already on the capacitor.
