This approach should be universally applicable to designing high-performance dielectrics for energy storage and other related functionalities. Multilayer ceramic capacitors (MLCCs) have broad applications in electrical and electronic systems owing to their ultrahigh power density (ultrafast charge/discharge rate) and excellent stability (1 - 3).

However, capacitors traditionally struggle with long-term energy storage. Within capacitors, ferroelectric materials offer high maximum polarization, useful for ultra-fast charging and discharging, but they can limit the effectiveness of energy storage. The new capacitor design by Bae addresses this issue by using a sandwich-like ...

Capacitors used for energy storage. Capacitors are devices which store electrical energy in the form of electrical charge accumulated on their plates. When a capacitor is connected to a power source, it accumulates energy which can be released when the capacitor is disconnected from the charging source, and in this respect they are similar to batteries.
