Graphene oxide was prepared by Hummers" method and then electrochemically reduced to produce graphene nanosheets. Physicochemical characterizations were performed using XRD, FTIR, FESEM, TEM, Raman and UV-Vis techniques to elucidate the structure and morphology of the prepared material. The electrochemical studies had been conducted on ...

Polycrystalline X-ray diffraction is an important tool to study the crystal structure of the material. Through analysis of the diffraction data, the structural parameters, e.g. lattice parameters, atomic site, grain size, grain orientation and stress distribution, can be retrieved, providing crucial information for studying relationship between structure and performance.

Sodium-ion batteries (SIBs) have demonstrated great application prospects in large-scale energy storage systems and low-speed electric vehicles due to the cost effectiveness and abundant resources. Layered transition-metal oxides are recognized as one of the most attractive sodium-ion storage cathode candidates by virtue of their high compositional diversity, ...

Energy storage is important for promoting the renewable energy consumption and improving the grid resilience. Cost of energy storage system is a key factor to determine whether the energy storage technology can be industrialized or not. In this paper, energy storage cost per kilowatt hour and per mileage were calculated for capacity type and power type energy storage ...

Moreover, gridscale energy storage systems rely on lithium-ion technology to store excess energy from renewable sources, ensuring a stable and reliable power supply even during intermittent ...

Sodium-ion batteries (SIBs) have attracted incremental attention as a promising candidate for grid-scale energy-storage applications. To meet practical requirements, searching for new cathode materials with high energy density is of great importance.
