Diodes - Redirect Energy. Going back to our PCB board - city comparison, diodes are basically the one-way streets on a printed circuit board. These two terminal components control and redirect energy flow by allowing the current to flow down one direction and blocking it from moving down the other.

Energy Storage. Next, let's talk about the energy stored in a capacitor. Say you have a fresh capacitor that has never been in a circuit. When a voltage is applied across the capacitor's terminals, current will flow into one of the capacitor's plates, creating a build up of charge, and flow out of the other plate, creating a negative charge.

Capacitors are another type of passive component found on circuit boards. They store electrical energy in an electric field and can release it when needed. Capacitors play a crucial role in many electronic circuits, such as filtering, energy storage, and coupling or decoupling signals. Capacitors soldered on Printed Circuit Board
