In combination with heat pumps, ice storage tanks serve as heat sources whose temperature is "pumped up" to the required heating water level by the heat pump. This is also referred to as ice storage heating. The work of the heat pump causes the water in the storage tank to freeze into ice. In summer, this ice can also be used to cool the rooms.

Shipping container homes consume much less energy, resulting in lower bills and a smaller carbon footprint. Usually, only one cooling unit is needed to keep a container home cooled and heated for comfort. For this, we like to use ductless mini-splits, which consist of an outdoor compressor or condenser connected to an indoor air-handling unit ...
