Types of Inverters. There are several types of inverters that might be installed as part of a solar system. In a large-scale utility plant or mid-scale community solar project, every solar panel might be attached to a single central inverter. String inverters connect a set of panels--a string--to one inverter. That inverter converts the power produced by the entire string to AC.

The energy storage system is then charged directly with DC output power from PV modules, and the PV array and energy storage system do not require DC to AC conversion. Oversizing often occurs with DC-coupled systems which is when the amount of solar energy produced exceeds the system's inverter rating.

In a DC-coupled system, the battery is directly connected to the direct current (DC) side of the power system -- the energy from panels goes directly into energy storage. In an AC-coupled system, the energy storage system is connected to the alternating current (AC) side of the power system. In both configurations, an inverter converts DC ...
