A gravity battery is a type of energy storage device that stores gravitational energy--the potential energy E given to an object with a mass m when it is raised against the force of gravity of Earth (g , 9.8 m/s^2) into a height difference h . In a common application, when renewable energy sources such as wind and solar provide more energy than is immediately required, the excess energy is used to move a mass upward agains...

kinds of energy when the sun isn't shining or the wind isn't blowing. This has created a high demand for energy storage systems to store excess electricity to be used at times of peak, but also during the evening when sources like solar are coming offline while demand is still high. When one thinks of energy storage, they likely think of

Gravity energy storage is getting noticed by investors and governors in large part for being so simple - all one needs are heavy objects, winding gear, and either a high tower or a very deep drop. There are minimal raw material requirements, a small land footprint per kWh, no harmful chemicals, low operational costs and high round-trip ...
