Clean Energy Source. Nuclear is the largest source of clean power in the United States. It generates nearly 775 billion kilowatt-hours of electricity each year and produces nearly half of the nation's emissions-free electricity. This avoids more than 471 million metric tons of carbon each year, which is the equivalent of removing 100 million cars off of the road.

The application scenarios of energy storage technologies are reviewed and investigated, and global and Chinese potential markets for energy storage applications are described. The challenges of large-scale energy storage application in power systems are presented from the aspect of technical and economic considerations.
