The rapid development of distributed photovoltaic (DPV) has a great impact on the electric power distribution network . Because of the mismatch between residential load and DPV output, the distribution network faces with the risk of undervoltage in peak load period and overvoltage in the case of full photovoltaic (PV) power generation .

With distributed photovoltaic (DPV) rapidly developing in recent years, the mismatch between residential load and DPV output leads to serious voltage quality problems. A double layer nested model of distributed energy storage (DES) planning is proposed in this paper to solve this problem.
