Even more energy is required to vaporize water; it would take 2256 kJ to change 1 kg of liquid water at the

normal boiling point (100°C) at atmospheric pressure) to steam (water vapor). This example shows that the energy for a phase change is enormous compared to energy associated with temperature changes without a phase change.

It has been verified that dynamic PCMs can stabilize the temperature of heat sources at heat fluxes approaching 3 kW cm^{-2} in the simulation, demonstrating their promising thermal management performance.
