

Dual oxygen intermediate energy storage material

To meet the growing energy demands in a low-carbon economy, the development of new materials that improve the efficiency of energy conversion and storage systems is essential. Mesoporous materials ...

Dual ion-conducting SOFC is another category that has gained enormous attention in recent years. In this SOFC, the electrolyte simultaneously diffuses oxygen as well as proton ions. ... this method is also used to produce desirable active materials for energy storage devices e.g., metal oxides can be produced by using the co-precipitation ...

In order to prevent the sintering of oxygen carriers, an efficient way is to apply chemical looping redox cycles below the tammann temperature [13, 34]. The tammann temperature of pure iron oxide is 698 °C, but pure iron oxides exhibit low activity below 800 °C [35]. A device of doping was proposed, and according to that a series of iron oxides doped by a ...

Emerging PEG/VO₂ dual phase change materials (PCM) with phase transition temperature gradients were prepared with polyethylene glycol (PEG) and vanadium dioxide (VO₂) through the vacuum impregnation method. To improve the stability, thermal conductivity, and thermal storage capacity of PEG/VO₂, expanded graphite (EG) with different mass gradients ...

The family of atomic transition metal-nitrogen-carbon (TM-N-C) materials has shown applaudable performance in oxygen electrocatalysis and great potential in replacing current commercial Pt-based catalysts [9, 10]. For instance, the carbon vacancy-modified Fe-N-C SACs (FeH-N-C) catalyst could effectively regulate the electronic properties and optimize the O ...

Achieving long-cycle-life, aqueous, dual-electrode-free Zn/MnO₂ batteries with high energy density is challenging. This work introduces a liquid crystal interphase in the electrolytes with soft ...

The oxygen reduction reaction (ORR) is the core of renewable energy conversion technology and plays an irreplaceable role in emerging electrochemical energy devices such as metal-air batteries ...

The CO₂ emission contribute significantly to global temperature rise and consequent climate destabilization. Thus, carbon capture, utilization, and storage (CCUS) technology is crucial to implement while using fossil fuels [1, 2]. However, for single CO₂ capture and conversion processes experience need high energy because of the complexity and high ...

The ever-growing pressure from the energy crisis and environmental pollution has promoted the development of efficient multifunctional electric devices. The energy storage and multicolor electrochromic (EC) characteristics have gained tremendous attention for novel devices in the past several decades. The precise design of EC electroactive materials can ...

Dual oxygen intermediate energy storage material

Redox materials have been investigated for various thermochemical processing applications including solar fuel production (hydrogen, syngas), ammonia synthesis, thermochemical energy storage, and air separation/oxygen pumping, while involving concentrated solar energy as the high-temperature process heat source for solid-gas reactions. Accordingly, ...

The universalized mechanism of OER in alkaline solution involves multiple electronic transfer steps, as shown in Figure 2a (red arrow). First, the OH⁻ in the solution adsorbed on the active sites (M) of the catalyst surface is oxidized by one electron to form M-OH. After that, M-OH transforms into an intermediate M-O after the removal of an electron-proton ...

Herein, we construct a novel electrocatalyst with Fe-Co dual sites embedded in N-doped carbon nanotubes ((Fe,Co)/CNT), which exhibits inimitable advantages towards the oxygen reduction reaction.

Direct methanol fuel cells system-A review of dual-role electrocatalysts for oxygen reduction and methanol oxidation ... have been the focal point of international advocacy for sustainability that stimulates the development of alternative energy storage and conversion devices (e.g. batteries, fuel cells, and super-capacitors) owing to their ...

Advancements in fuel cells and water electrolyzers have significantly bolstered the utilization of hydrogen energy. Notably, the oxidation and reduction processes of oxygen at the electrode--termed oxygen evolution reaction (OER) and oxygen reduction reaction (ORR)--manifest sluggish reaction kinetics, thus requiring noble metals as catalysts, which ...

For this reason, Xiao et al. designed and constructed an FeCoN₅ dual-atom site catalyst without metal bonds, where water spontaneously dissociates at the center to generate a new FeCoN₅ ...

Energy Storage Materials 45:805-813; DOI: ... and to promote the adsorption capability of oxygen and intermediate products such as O₂^{*}, OOH^{*}, O^{*} and OH^{*} [55]. The graphitic nitrogen ...

In the context of the global pursuit of sustainable energy, dual-atom catalysts (DACs) have attracted widespread attention due to their unique structural and excellent catalytic performance. Unlike the single-atom catalysts, DACs possess two active metal centers, exhibiting intriguing synergistic effects that significantly enhance their efficiency in various ...

select article Rational design of a heterogeneous double-layered composite solid electrolyte via synergistic strategies of asymmetric polymer matrices and functional additives to enable 4.5 V all-solid-state lithium batteries with superior performance

Lithium borohydride (LiBH₄) has been attracting extensive attention as an exemplary high-capacity complex

hydride for solid-state hydrogen storage applications because of its high hydrogen capacities (18.5 wt% and 121 kg H₂ m⁻³). However, the strong and highly directional covalent and ionic bonds within LiBH₄ structure induce high desorption temperatures, slow ...

FOR ENERGY CONVERSION AND STORAGE Advanced ceramics are to be found in numerous established and emerging energy technologies.³ First, ceramic materials Received: 22 December 2020 | Revised: 13 March 2021 | Accepted: 15 March 2021 DOI: 10.1002/ces2.10086 REVIEW ARTICLE Ceramic materials for energy conversion and storage: A perspective

The oxygen reduction reaction (ORR) and oxygen evolution reaction (OER) are crucial electrochemical reactions that play vital roles in energy conversion and storage technologies, such as fuel ...

Solar-driven electrocatalytic water splitting for hydrogen production is an attractive strategy for renewable and sustainable energy conversion and storage [1], [2], [3]. However, the large-scale application of water splitting has been restricted by the oxygen evolution reaction (OER) with slow kinetics at the anode [4], [5], [6] pared with the scenario at low current density (<100 mA ...

In summary, the nitrogen and oxygen dual-doped carbon material with abundant heteroatoms, unique microporous bowl-shaped microstructure, and proper electrical conductivity was successfully synthesized through a combined strategy of low-temperature defluorinated carbonization and KOH-etched activation using the 3-fluorophenol-3-amino-4 ...

However, it is in desperate need of the design of optimized carbon materials for Zn-I₂ battery with dual energy storage mechanisms that are consisted of tunable mesopores and oxygen-containing functional groups for the effective immobilization of iodine species and additional redox reactions, respectively.
