

Abstract. It is anticipated that utilizing the underground space in abandoned mines to build and operate pumped-storage hydroelectricity (PSH) plants can reduce capital investment and geological constraints. However, there are currently few detailed investigations into techno-economic feasibility except for conceptual studies. In this paper, an underground ...

Compressed gas energy storage technology (CGES) is one effective solution to this problem. Compared to battery energy storage, CGES is a type of physical energy storage, which offers large capacity, high safety, and long-life cycle [3]. Although pumped hydro energy storage (PHES) possesses the above-mentioned advantages, CGES does not depend on significant ...

A techno-economic analysis has been performed for a renewable energy system using hydrogen via water electrolysis as an energy carrier to mitigate the variability of renewable sources. The optimal LEC is found to be 227 \$/MWh and 167 \$/MWh for the two case study locations, which is comparable to today's electricity cost.

What can water storage valuation tell us of the difference between optimal and historical water management decisions? Economic valuation of water across space and time ...

Introduction. Alkaline water electrolysis (AWE) is a mature hydrogen production technology (Ursua et al., 2012) and there exists a range of economic assessments for available technologies most cases, these assessments focus on typical cost components such as investment, operation and maintenance (O& M), and decommissioning, which are commonly ...

Lesser amounts of storage will have economic impacts between that of the baseline turbine (with no storage) and the turbine with 24 h of energy storage. Fig. 10 compares the total LCOE of the original system with a 5 MW electrical connection line to one with 24 h of storage and a 2.5 MW electrical connection line size.

While the effect of the recuperation temperature on the techno-economic analysis has not been discussed. Blanquiceth [32] presented several layouts of integrating the PTES into a thermal power plant and concluded that the supercritical water Rankine cycle has higher round-trip efficiency (RTE) and energy storage density than other cycles. The ...

Salt water battery is among the promising storage options in line of sustainability.. Proper sizing is necessary for compatibility with power system operation.. The realized payback period (PBP) of the storage system was found to be 15.53 years.. The obtained Internal rate of return (IRR) of the storage system was 15%.. Sensitivity and LMP analyses showed their ...

The study's results are documented through a report on the feasibility and viability of m-PSH and a report on a predictive cost methodology for m-PSH. Impact/Intended Impact From its research, the project team developed a general cost estimate for m-PSH projects with installed capacities of less than 100 MW.

A recent report discusses hydrogen storage costs in Europe, 20 but sources of these costs and the equations used by the study are missing. At the same time, learning experiences are not considered. This highlights the need for a comprehensive European-scale study of capacity assessment and cost analysis.

Here, we contribute a global-to-basin-scale exploratory analysis of potential water scarcity impacts by linking a global human-Earth system model, a global hydrologic ...

Lake is an important water resources in Mongolia, which has undergone a large variation in past decades. However, it is still challenging to monitor long-term changes in lake water storage (LWS ...

Water scarcity is a growing problem in many areas of the world, with increasing pressure from population growth [1], [2]. The majority of global freshwater consumption, 70%, is currently used for agriculture [3] irrigation with brackish water from marginal-quality aquifers is largely practiced in Middle Eastern countries, but is limited by a variety of drawbacks such as ...

The techno-economic analysis includes thermodynamic flowsheet simulations and unified cost estimations based on the used equipment. It is shown that the main input data set (e.g. working fluid selection, turbomachinery efficiency, pinch temperatures) has a strong influence on storage roundtrip efficiency in the thermodynamic simulations, but ...

Indirect liquid cooling is a heat dissipation process where the heat sources and liquid coolants contact indirectly. Water-cooled plates are usually welded or coated through thermal conductive silicone grease with the chip packaging shell, thereby taking away the heat generated by the chip through the circulated coolant [5]. Power usage effectiveness (PUE) is ...

Another document gives information on the price analysis of offshore wind power installation, including water electrolysis using SOEL, PEMEL, and AEL. This analysis showed a strong correlation between the offshore location of the hydrogen-producing plant and the hydrogen transit mode [41]. For the transfer of hydrogen produced from offshore ...

Some assumptions are made to simplify the economic analysis and are listed in Table 8. In this table, stack replacement cost for 2020, 2030, and 2050 is estimated to be the average values available in different papers and reports. For example, stack replacement of SOEC is assumed to be 13.5% of the initial CAPEX in 2030.
