Storage electric boilers. Storage electric boilers work in much the same way as the direct type, but the system has a storage tank that means the water can be stored for use later. The tank can sometimes be built into the boiler, making the unit a little bigger than a direct boiler, or can sometimes be located elsewhere in the house.

And, since it's smart, it can store heat at the greenest times making it a better choice than an electric boiler, which uses peak (or the dirtiest) electricity. ... The ZEB is powered by electricity and works like a battery to store energy as heat until it is needed ...

Commercial electric boilers are highly efficient, converting nearly all of the electrical energy they consume into heat. Unlike traditional fuel-burning boilers, there is no energy lost through combustion. This high efficiency translates into significant cost savings on energy bills, making electric boilers an attractive long-term investment. 2.

In the 1980s, as grid connections between countries improved and rising electricity prices, thermal energy storage became less attractive and the popularity of electric boilers declined even in Norway. Subsequently, around 2010, a new market for electrode boilers appeared: regulation of networks with a growing share of intermittent wind generation.

A traditional fired boiler needs a combustion chamber and a tube section to transfer heat from the flame to the water. This results in large, heavy and costly construction. In the electrode boiler heat is generated directly in the compact water volume between the electrodes. The electrode boiler uses medium voltage, in the range 6-24 kV.
