How Thermal Energy Storage Works. Thermal energy storage is like a battery for a building's air-conditioning system. It uses standard cooling equipment, plus an energy storage tank to shift all or a portion of a building's cooling needs to off-peak, night time hours. During off-peak hours, ice is made and stored inside IceBank energy storage tanks.

Chillers can be operated during off-peak hours when electricity demand is lower or when energy from renewable sources is more readily available. This helps reduce the carbon intensity associated with electricity generation. Thermal Energy Storage System (Charging of Storage Tank) Reduced Grid Strain
