Among all other renewable energy sources, ocean wave energy has the second-largest prospect [12]. The ocean is beyond 70 % surface of the earth, and water has an abundance of resources [13]. Furthermore, the ocean represents the world's largest unexplored source of energy. Wave energy has a far bigger power density than wind or solar energy.

The time lag between  $E$  and  $P$  implies the absorption of electromagnetic radiation caused by an irreversible degradation of free energy and leads to the attenuation of electromagnetic waves passing through the medium, showing, in this way, the relaxation band shown in Fig. 2.3 (see blue curve in the upper panel).

The process of EM wave absorption can be referred to the EM wave energy loss, where the EM wave energy is depleted and then transformed into other energy, such as heat, and in result the EM wave cannot be reflected or permeated through the absorber materials (Huo et al. 2009; Qin and Brosseau 2012).
