Disasters like the wildfires in California, Hurricane Maria and Hurricane Fiona in Puerto Rico, and the Texas winter storm of 2021 have caused catastrophic power outages that left communities without power for weeks or even months, demonstrating the importance of energy resilience for critical facilities and services.

The results indicate that the co-dispatch of mobile energy storage systems and repair crews can reduce the outage scale and duration in the power distribution system. With power supply from mobile energy storage systems, the restoration strategies of repair crews can be more flexible to ensure that the lost loads are restored in a short time.

This paper provides a comprehensive and critical review of academic literature on mobile energy storage for power system resilience enhancement. As mobile energy storage is often coupled with mobile emergency generators or electric buses, those technologies are also considered in the review.

For example, the DOE's SunSmart program helped equip more than 100 schools with backup solar and storage systems. In response to power system vulnerabilities revealed by Superstorm Sandy, the New York Governor's Office of Storm Recovery aims to place solar panels and energy storage systems in flood-prone areas.

The fire codes require battery energy storage systems to be certified to UL 9540, Energy Storage Systems and Equipment. Each major component - battery, power conversion system, and energy storage management system - must be certified to its own UL standard, and UL 9540 validates the proper integration of the complete system.

After the power recovery of EPSVs, some loads in microgrid 4 and 5 are restored. However, due to the limitation of energy storage capacity, there is still a part of load blackout. The emergency degree of power failure load in microgrid 4 is 0.7175, and the degree in microgrid 5 is 0.3427.

Installing and maintaining renewable energy systems requires skilled labor, which can boost economic recovery in disaster-hit areas. 3. Lower Recovery Costs. Renewable energy can reduce the costs associated with disaster recovery. By providing a sustainable and reliable energy source, communities can avoid the expense of temporary diesel ...

For mobile energy solutions, constraints such as location, transportability, and cost come into question. The most common practice is using truck-mounted diesel generators with power capacities ...

In the high-renewable penetrated power grid, mobile energy-storage systems (MESSs) enhance power grids' security and economic operation by using their flexible spatiotemporal energy scheduling ability. It is a crucial flexible scheduling resource for realizing large-scale renewable energy consumption in the power system. However, the spatiotemporal ...

During emergencies via a shift in the produced energy, mobile energy storage systems (MESSs) can store excess energy on an island, and then use it in another location without sufficient energy supply and at another time [13], which provides high flexibility for distribution system operators to make disaster recovery decisions [14].
