The present study investigates the influence of three different types of thermal insulation materials (AG-ST-POF, PC-AG-ST-POF, SI) on thermal runaway propagation (TRP) among large-format batteries through experimental analysis. Considering the high energy density of the battery pack, the insulation material is 1 mm thick.

The thermal spreading interval time between the first and second batteries in the battery module was increased to an infinite length, when the composite phase change type thermal insulation layer was used. The zero-spreading effect of thermal runaway in the battery module was achieved.
