A renewable energy-based power system is gradually developing in the power industry to achieve carbon peaking and neutrality [1]. This system requires the participation of energy storage systems (ESSs), which can be either fixed, such as energy storage power stations, or mobile, such as electric vehicles.

How do battery energy storage systems work? Simply put, utility-scale battery storage systems work by storing energy in rechargeable batteries and releasing it into the grid at a later time to deliver electricity or other grid services. Without energy storage, electricity must be produced and consumed at exactly the same time.
