Cement is a component of concrete, and concrete is the most-consumed material on the planet, second only to water, which is kind of crazy. 19 On a global level, cement and concrete production accounts for 8 to 9% of greenhouse gas emissions and 2 to 3% of energy demand. 17 But while concrete isn't going away anytime soon, maybe its reliance ...

It has been proven that paraffin can be used effectively as a thermal energy storage medium into bricks under high temperatures [30]. Moreover, it can effectively shift the thermal load and improve concrete bricks' inertial capability [31]. The main thermo-physical properties of used paraffin are listed in Table 2.

The process is similar to a pumped-storage hydropower plant (HPP), with water substituted with concrete blocks and gravity doing the rest. The energy storage technology has been invented by a Swiss-based startup called Energy Vault, which recently received a USD 110 million investment from Softbank Group. Why
