State-of-the-art cryogenic tanks for LH 2 storage originate from the storage tank developed for LN 2 with barely any changes. Perlite and a vacuum of $\sim 10^{-2}$ mbar are used for insulation and give a k-value of ~ 1.0 mW/m²/K. The typical boil-off loss of current LH 2 tanks varies from 1% to 5% per day . In practice, it has become more and more ...

Existing compressed-air energy storage devices are primarily rigid structures, such as compressed-air tanks [6], gas fire extinguishers [7], portable nitrogen cylinders [8], and natural gas storage tanks [9]. These devices are advantageous because they are capable of high-pressure and long-lasting gas storage; however, they have poor portability and cannot store ...

Hydrogen can be stored physically as either a gas or a liquid. Storage of hydrogen as a gas typically requires high-pressure tanks (350-700 bar [5,000-10,000 psi] tank pressure). Storage of hydrogen as a liquid requires cryogenic temperatures because the boiling point of hydrogen at one atmosphere pressure is -252.8°C .
