The BMS does not provide the same functionalities as an Energy Management System (EMS). The primary job of the BMS is to protect the battery from damage in a wide range of operating conditions. It does so by ensuring that the battery cells operate within their prescribed operating windows for the state of charge, voltage, current, and temperature.

The presence of oscillating inlet temperature in the latent heat thermal energy storage device does not impair the heat storage capacity of the device. When the frequency parameter  $\alpha$  is increased from 1 to 10, the reduction in complete melting time is only 3.4%.

Energy storage is key to secure constant renewable energy supply to power systems - even when the sun does not shine, and the wind does not blow. $E_k = \frac{1}{2} I \omega^2$ ; where  $I$  is the moment of inertia and  $\omega$  is the angular velocity of the rotating disc; when  $\omega$  or  $I$  increases, the energy of the system increases.. Once made of steel, flywheels are now made of a carbon fiber composite which has a high tensile strength and can store much more energy.

That is, it stores energy in the form of kinetic energy rather than as chemical energy as does a conventional electrical battery. Theoretically, the flywheel should be able to both store and extract energy quickly, and release it, both at high speeds and without any limit on the total number of cycles possible in its lifetime.
