

# Energy storage door hinge

We are full timers so this larger configuration with abundant storage was warranted. The rear storage compartment uses a very large and heavy door. When fully opened, the door is raised vertically up against the body and held there by two magnetic bumpers. All of the weight of the door rests on a single large horizontal hinge.

With the rise in the need for secure campuses, electrified hinges have become a go-to solution. They are often used in research labs, administrative offices, and equipment storage rooms. Educational institutions can protect valuable assets and ensure student safety by controlling access to these areas.

While standard hinges enable a door to swing open or shut, an electrified hinge goes further. It's engineered to convey electrical current between the door and its frame, adding an element of electricity transfer to its function. Inside an electrified hinge, concealed wiring connects to both the door's and the frame's electrical components.

The electrical generation system of claim 1, wherein the door includes a hinge and the cam is connected to the hinge for rotation with the door between the closed position and the open...

Secure the Hinge: Attach the hinge to the door's center, ensuring the electrical connections align correctly. Test the Setup: Once installed, test the hinge's functionality and the flow of electricity to ensure everything is working as intended. Do the following to maintain the longevity and proper functioning of an electrified hinge:
