Energy storage sites and systems should be kept secure from both physical and cyber-threats, just as with any grid-connected resource. Access to energy storage equipment should be firmly restricted, with sites and/or enclosures secured against very robust attempts at ingress.

In power industry, the safety issue is always of great importance. As the first hydrogen based project in China power sector, the safety level of platform had drawn great attention during the project. However, there are few standards to follow regarding safety analysis for hydrogen energy storage system in power industry.

2. Electrostatic charge generation: Due to the very low minimum ignition energy characteristics of hydrogen, some weak ignition sources, such as electrical equipment sparks, electrostatic sparks, and frictional impact sparks, are sufficient to cause ignition in hydrogen-air combustible mixtures (Dryer et al., 2007).

Ultimately, energy storage safety is ensured through engineering quality and application of safety practices to the entire energy storage system. Design and planning to prevent emergencies, and to improve any necessary response, is crucial.

1) Encourage multi-industry enterprises to invest in energy storage industry, so as to screen out more cost-effective energy storage technology and equipment. 2) Encourage different energy storage technologies to be applied to different energy industries through demonstration projects or open bidding.
