In physics, energy density is the quotient between the amount of energy stored in a given system or contained in a given region of space and the volume of the system or region considered. Often only the useful or extractable energy is measured. It is sometimes confused with stored energy per unit mass, which is called specific energy or gravimetric energy density.

Currently, the calculations of MOFs, especially for large-scale high-throughput screening are preferably conducted by applying molecular mechanics method (MMM) that based on the forcefield parameters, which means that the fitted experimental results or high-leveled QMM results are used as the energy expression of the potential energy surface (PES).
