It is difficult to transfer energy stored in the winding to the other circuit (often isolated one), and transient conditions can cause serious stress on components. The stored energy in a coupled inductor can be used in multiple ways, both in isolated and non-isolated manners.

Energy is stored in a magnetic field. It takes time to build up energy, and it also takes time to deplete energy; hence, there is an opposition to rapid change. In an inductor, the magnetic field is directly proportional to current and to the inductance of the device. It can be shown that the energy stored in an inductor (E_{ind}) is given by
