An inductor is a component in an electrical circuit that stores energy in its magnetic field. Inductors convert electrical energy into magnetic energy by storing, then supplying energy to the circuit to regulate current flow. This means that if the current increases, the magnetic field increases. Figure 1 shows an inductor model.

The literature [9] simplified the charge or discharge model of the FESS and applied it to microgrids to verify the feasibility of the flywheel as a more efficient grid energy storage technology. In the literature, [10] an adaptive PI vector control method with a dual neural network was proposed to regulate the flywheel speed based on an energy optimization ...

Based on this magnetic field, we can use Equation (14.22) to calculate the energy density of the magnetic field. The magnetic energy is calculated by an integral of the magnetic energy density times the differential volume over the cylindrical shell. After the integration is carried out, we have a closed-form solution for part
