The right optimisation strategies and technologies can enable the right balance between maintaining battery health and profitability, writes Laura Laringe, CEO of optimisation software provider reLi Energy. In the rapidly evolving landscape of renewable energy, the demand for efficient and sustainable energy storage solutions is crucial.

With a low-carbon background, a significant increase in the proportion of renewable energy (RE) increases the uncertainty of power systems [1, 2], and the gradual retirement of thermal power units exacerbates the lack of flexible resources [3], leading to a sharp increase in the pressure on the system peak and frequency regulation [4, 5]. To circumvent this ...

The profitability of the company's dynamic storage batteries is stable. The company's gross profit margin for power batteries in 2023 will be 14.37%, a year-on-year increase of -1.59 pct, and the gross profit margin of energy storage batteries will be 17.03%, a year-on-year increase of +8.07 pct.

Through rigorous analysis, it is proved that the optimal BESS control is a "state-invariant" strategy in the sense of the optimal SoC range does not vary with the state of the system. We consider a two-level profit-maximizing strategy, including planning and control, for battery energy storage system (BESS) owners that participate in the primary frequency control ...
