Abstract. Recently, there has been a renewed interest in solid-to-liquid phase-change materials (PCMs) for thermal energy storage (TES) solutions in response to ambitious decarbonization goals. While PCMs have very high thermal storage capacities, their typically low thermal conductivities impose limitations on energy charging and discharging rates. Extensive ...

Latent heat thermal energy storage has high storage potential in low required volume, good thermal performance and high temperature control at the discharge. Latent energy storage is possible with the help of PCM materials. Slab plate heat exchanger is a technical and cost beneficial system to store latent thermal energy using PCM.

This design lends itself to very high heat transfer efficiency due to large surface area - much higher than a shell and tube heat exchanger taking up similar space. Plate heat exchangers are also much easier to clean and maintain, because they're designed to be relatively easy to disassemble and inspect. Also, if there is a defect in a ...

The pillow plate heat exchanger based on latent heat thermal energy storage comprises plate panels while the phase change material was filled in the space formed by adjacent plates. The plate panel was manufactured by two metal sheets, which connected by laser-welded at the edges, and then welded the distribution of two flow channels.

efficient plate heat exchanger thermal energy storage system (PHETES), which is depicted in Fig. 1.
