2.2 Energy In a q -stage system, the overall stored energy is the summation of the kinetic energy of all parts. Therefore, we have $E_1 = \frac{1}{2} I \omega^2$ $E_q = \frac{1}{2} I_q \omega_q^2 = q \cdot \frac{1}{2} I \omega^2$ $E_q = \frac{1}{2} I q \omega^2 = q^2 I \omega^2$
 (5) As a result, the total absorbed kinetic energy of the system would be $E_{total} = \frac{1}{2} \omega^2 \sum k = \frac{1}{2} q^2 I \omega^2$...

The high cost of flywheel energy storage per kilowatt hour is one of the key factors restricting its promotion and application. Therefore, the selection of appropriate rotor materials and the design of rotor structure are the key to reducing the cost of flywheel energy storage, which is crucial for the promotion of flywheel energy storage.

Existing energy storage systems use various technologies, including hydro-electricity, batteries, supercapacitors, thermal storage, energy storage flywheels,[2] and others.
