The carbon shell acted as a reliable protective barrier, safeguarding the structural and electrochemical integrity of the Janus structure. Consequently, the energy storage system exhibited enhanced performance and long-term durability, making it a promising solution for advanced applications.

Energy Storage Systems are structured in two main parts. The power conversion system (PCS) handles AC/DC and DC/AC conversion, with energy flowing into the batteries to charge them or being converted from the battery storage into AC power and fed into the grid. Suitable power device solutions depend on the

voltages supported and the power flowing.

Japan uses the term "electrical storage systems" in its technology standards and guidelines for electrical equipment to refer to electromechanical devices that store electricity. In the case of the US, the equivalent term is "rechargeable energy storage systems," defined in its National Electrical Code (NEC).
