The large capital investment in grid-connected energy storage systems (ESS) motivates standard procedures measuring their performance. In addition to this initial performance characterization of an ESS, battery storage systems (BESS) require the tracking of the system's health in terms of capacity loss and resistance growth of the battery cells.

No matter how well code is written, bugs are inevitable in even the most carefully designed software systems. This is why debugging and testing occupy a significant portion of a developer's time and effort. By implementing robust testing and debugging practices, issues can be identified early and resolved quickly to keep projects on track.
