This paper argues that the cost of storage is driven in large part by the duration of the storage system. Duration, which refers to the average amount of energy that can be (dis)charged for each kW of power capacity, will be chosen optimally depending on the underlying generation profile and the price premium for stored energy.

To capture the unit cost associated with energy storage, we introduce the Levelized Cost of Energy Storage (LCOES) which, like the commonly known Levelized Cost of Energy, is measured in monetary units (say U.S. \$) per kWh.

In general, energy storage systems find seven major applications, as described in Table 1, especially at the utility scale level. Frequency regulation, renewable energy grid integration, energy arbitrage, and end-user demand management are among the leading applications. ...
