The evaluation results show that the safety risk probability  $P_{TR}$  obtained using high ISC trigger temperatures is optimistic. Therefore, low ISC trigger temperatures should be used in evaluations. Moreover, the degradation will increase the thermal safety risk; for example,  $P_{TR}$  increases from  $4.2 \times 10^{-5}$  to  $3.1 \times 10^{-4}$  after 1000 cycles ...
