A flywheel is a simple form of mechanical (kinetic) energy storage. Energy is stored by causing a disk or rotor to spin on its axis. Stored energy is proportional to the flywheel's mass and the square of its rotational speed. Advances in power electronics, magnetic bearings, and flywheel materials coupled with

Energy Storage Systems (ESSs) play a very important role in today's world, for instance next-generation of smart grid without energy storage is the same as a computer without a hard drive [1]. Several kinds of ESSs are used in electrical system such as Pumped Hydro Storage (PHS) [2], Compressed-Air Energy Storage (CAES) [3], Battery Energy Storage (BES) ...

How the Flywheel Works. The flywheel energy storage system works like a dynamic battery that stores energy by spinning a mass around an axis. Electrical input spins the flywheel hub up to a high speed and a standby charge keeps the unit spinning until its called upon to release . its energy. The energy is proportional to its mass and speed squared.
