As more and more ethanol is introduced to the motor-fuel supply chain, handlers need to be aware of potential conditions like "phase separation" ... leaving two distinct layers in the storage tank, a gasoline-only layer at the top and an ethanol/water "cocktail" along the bottom (see Figure 2). As mentioned, this can be a concern at any point ...

Storage Tank Types . Any large volume of denatured fuel ethanol will typically be stored in conventional carbon steel storage tanks, such as those that are suitable for gasoline and other flammable fuels. Denatured fuel ethanol can also be stored in stainless steel storage tanks, although these tanks are less common.

Commencing just about 2002, a number of ethanol storage tanks at blending terminals which have been used for a period of <2 years suffered leaks owing to SCC [14, 15]. Afterwards, more than 35 incidences of SCC failures in tanks, ... handling and storage of fuel ethanol . Generally, carbon steel is thought as compatible with fuel ethanol from ...

The ethanol in modern fuel is hygroscopic, meaning it attracts water. That H₂O content can reach a point where it will separate from the fuel, especially in long term storage. That water sitting at the bottom of the tank is the first thing to be picked up by the fuel pickup.

During the past decade, there has been evidence of stress corrosion cracking of steel storage tanks and associated piping used in fuel ethanol service. While SCC has not been wide spread, it has produced failures in some user facilities. No failures have been identified in facilities that produce fuel ethanol.

STA-BIL and Ethanol Shield have their own proprietary corrosion inhibitors to reduce rust and oxidation inside tanks and fuel lines. So in summary, the right additive package can stabilize fuel chemistry, remove deposits, control water, and prevent corrosion. ... What is the best fuel stabilizer for ethanol fuel? Ethanol Shield is likely the ...

environments. Today, the widespread use of ethanol-blended gasoline (E10, E15, E85), biodiesel fuels and ultra-low sulfur diesel (ULSD) has shifted the concern about corrosion to include internal protection. Most significantly, new ethanol-blended fuels raise questions about the compatibility of storage tank materials with stored fuel.

In general, Ethanol is compatible with almost all aboveground fuel storage tanks, however high percentage ethanol blends such as E85 can corrode aluminum and certain grades of plastic and rubber. Ethanol is actually more forgiving of water within a tank because it absorbs a small percentage of the moisture.

Fuel Pump tags and collars keep tanks and containers organized when being stored by clearly labeling the contained contents. Valve I.D. tags label exactly what fuel or liquid type is going to be dispensed from any certain valve. Keeping your tanks and valves identified with tags eliminate any potential hazards or confu

storage tanks, such as those that are suitable for gasoline and other flammable fuels. Denatured fuel ethanol can also be stored in stainless steel storage tanks, although these tanks are less common. As consumption increases, larger ethanol tanks will become increasingly prevalent.

Fuels Compatibility Statement All steel tanks are compatible with all blends of fuels meeting ASTM standards.
