Electrostatic capacitors are critical components in a broad range of applications, including energy storage and conversion, signal filtering, and power electronics [1], [2], [3], [4]. Polymer-based materials are widely used as dielectrics in electrostatic capacitors due to their high voltage resistance, flexibility and cost-effectiveness [5], [6], [7].

Polymers with high dielectric breakdown strength (E_b) over a broad temperature range are vital for many applications. The presence of weak points, such as voids and free volume, severely limit the E_b of many high-temperature polymers. Here, we present a general strategy to reduce these weak points by exploiting interchain electrostatic forces in polymer blends.
