As can be expected with emerging technologies, regulatory policy is lagging the energy storage technology that exists today. Besides wholesale market rules, retail rules will also need to be updated, especially as residential and commercial and industrial interest grows. Incomplete definition of energy storage.

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.

Energy storage isn't just about integrating intermittent wind and solar output: Battery solutions, which can be deployed rapidly and with pinpoint precision, can be used to make the overall grid more efficient and resilient, regardless of the generation sources. This makes the storage story all the more compelling.

Increasingly, though, chargeable batteries are being used for residential and mobile energy storage. They are already used in hybrid and electric cars. In April 2015, electric car maker Tesla unveiled a new range of batteries for the home, providing a shot of publicity for the small but fast growing home energy storage sector.

The Electricity Storage Valuation Framework report proposes a five-phase method to assess the value of storage and create viable investment conditions to guide storage deployment for the effective integration of solar and wind power.

Surging adoption of digitalization and AI technologies has amplified the demand for data centers across the United States. To keep pace with the current rate of adoption, the power needs of data centers are expected to grow to about three times higher than current capacity by the end of the decade, going from between 3 and 4 percent of total US power ...

Understanding S-curve Growth Dynamics . According to the International Energy Agency, to limit global warming to 1.5 degrees C, renewables will need to reach 61% of global electricity by 2030 and 88% by 2050, with solar and wind making up the dominant share.. Reaching such high levels of renewables sounds daunting, but is less so when you consider ...
