The breeders can transfer the eggs to new tanks when they hatch or wait for the fry to come out of their eggs. Regardless, you need to separate the clownfish from their babies after hatching and put them in separately-framed tanks. As embryos, clownfish hatchlings use the yolk as their only source of sustenance.

It does not need to be very big, a 10 gallon (37.8 l) tank will do fine for the hatchlings. Make sure the tank does not have a large filtration system but instead has an air stone that lets off little bubbles or some other more gentle means of oxygenation. Too much filtration could easily kill all your tiny fry.
