Europe and China are leading the installation of new pumped storage capacity - fuelled by the motion of water. Batteries are now being built at grid-scale in countries including the US, Australia and Germany. Thermal energy storage is predicted to triple in size by 2030. Mechanical energy storage harnesses motion or gravity to store electricity.

The ABS energy storage device works by capturing and storing energy generated during braking. When a vehicle slows down, kinetic energy is produced, which, under traditional mechanical systems, is wasted as heat. However, Toyota's innovative approach allows for this energy to be harnessed, ensuring that it can be reused rather than dissipated
