Energy storage systems (ESSs), with the ability to alternatively charge and discharge energy, can provide a wide range of grid services [2, 3 00] to tackle the above challenges. There are several ways to categorize these services. A common method is based on the time scale of the charge/discharge cycle.

Europe and China are leading the installation of new pumped storage capacity - fuelled by the motion of water. Batteries are now being built at grid-scale in countries including the US, Australia and Germany. Thermal energy storage is predicted to triple in size by 2030. Mechanical energy storage harnesses motion or gravity to store electricity.
