A common approach to thermal storage is to use what is known as a phase change material (PCM), where input heat melts the material and its phase change -- from solid to liquid -- stores energy. When the PCM is cooled back down below its melting point, it turns back into a solid, at which point the stored energy is released as heat.

Thermal energy can be stored as sensible heat in a material by raising its temperature. The heat or energy storage can be calculated as. $q = V r c_p \Delta T = m c_p \Delta T$ (1) where . q = sensible heat stored in the material (J, Btu) V = volume of substance (m^3 , ft^3) r = density of substance (kg/m^3 , lb/ft^3) m = mass of substance (kg, lb)
